Hiring Team
Adobe
San Jose, CA

Dear Adobe Team,

Adobe's GenAI services team is building the shared infrastructure — Evaluation Service, Voice Service, Moderation Service — that every product team at Adobe will rely on. That kind of platform-level, high-leverage work is exactly what I want to be doing. I'm applying for the Junior Software Development Engineer role on that team.

Here's why I'm a direct fit:

- **GenAI services in production — exactly what this team builds.** CortexQ is a Python FastAPI microservice that routes and evaluates LLM inference across Claude, GPT-4o, and Gemini with EWMA latency-aware load balancing, Redis queuing, and Kubernetes autoscaling. It directly parallels Adobe's Evaluation Service: multi-model routing, performance measurement, and operational reliability at scale. This isn't exposure — I've built and shipped this in production.
- **Production LLM features shipped at enterprise scale.** At Isomer AI, I deployed 10+ production AI features — multi-model LLM pipelines, Temporal.io agentic workflows with MCP tooling, Auth0 RBAC — across 923 commits and 7 deployments to enterprise clients. I understand how to take GenAI capabilities from prototype to production in a shared services context.
- **Observability, DevOps, and platform reliability.** CortexQ ships with OpenTelemetry + Prometheus + Grafana and GitOps delivery via Helm + ArgoCD. At Isomer, I managed CI/CD pipelines, integrated Sentry APM, and resolved production incidents on-call. The CL platform operational work in this role is a natural extension of how I already work.
- **Full-stack and cross-functional experience.** AlgoPulse shows TypeScript + Temporal.io event-driven architecture with a React Native mobile client scaled to 2,000 concurrent requests. PulseRank demonstrates complex data modeling, multi-store consistency testing with Testcontainers, and Server-Sent Events for real-time UI — the kind of full-stack depth Adobe's shared GenAI services require.

I'd welcome the chance to talk about how my background maps to the GenAI services roadmap.

Sincerely,

Aditya Kulkarni
