

Software Development Engineer 2026

June 20, 2026

Amazon engineers build systems that run at a scale most engineers never see. That is exactly the environment I have been preparing for — distributed, high-throughput, correctness-critical infrastructure where ownership means shipping and maintaining, not just committing.

Why I am a strong fit:

- **Java and distributed systems depth.** *InventoryReservationService*: Java 21 + Spring Boot REST API with PostgreSQL row-level locking (SELECT FOR UPDATE), idempotent endpoints, RFC 9457 error handling, and Testcontainers concurrency tests that verify exactly one success and one 409 Conflict under race conditions. *KubeServe*: Kubernetes-native LLM inference platform with FastAPI, KEDA autoscaler, Kopf CRD operator, circuit breaker, and EWMA load balancing — deployed via ArgoCD, load tested to 500 VUs.
- **Proven scale: 2,000 req/sec on AWS.** *AlgoPulse*: real-time competitive coding platform with Temporal.io durable workflows, Judge0 sandboxed execution, Kafka event streaming, Redis pub/sub leaderboard — load tested to 10,000 concurrent users with sub-100ms latency on AWS auto-scaling infrastructure.
- **Production GenAI engineering.** At Isomer AI I shipped features across a per-tenant insurance AI platform powering 30+ production deployments — Temporal.io orchestration, multi-model LLM pipelines (Claude, GPT-4o, Gemini), MCP server tooling, and Playwright browser automation. Mphasis: 5+ AI workflows improving accuracy by 25% across 10K+ daily medical claims. Amazon's bet on GenAI is where my production experience compounds.
- **Ownership across the full SDLC.** *Capgemini*: reduced ticket resolution time 15% by owning end-to-end pipeline (Kafka + Spark + Hadoop). *Expertiza* open source: 110+ RSpec tests, 25% coverage increase, 300+ contributor codebase. I do not hand off — I debug, iterate, and ship.

I want to build systems that millions of people depend on. Amazon is the right place to do that.
