

Forward Deployed AI Engineer, East — Arize AI

June 20, 2026

Arize solves the hardest problem in production AI: knowing when your model is wrong before your customers do. I built the tools that expose exactly those failure modes — and I want to bring that work into Arize's field engineering team.

Why I am a strong fit:

- › **I built Arize's product space from scratch.** LLM Eval Harness: vendor-neutral Python benchmark comparing Claude, GPT-4o, and Gemini across 2,000 frozen examples — hallucination rate, p50/p95 latency, cost-per-call, McNemar significance tests across 6 metrics. VectorLift: RAG evaluation pipeline on MS MARCO with bi-encoder + cross-encoder re-ranker, NDCG@10/MRR@10/MAP benchmarks, Kafka-driven Qdrant ingestion. These are not toy projects — they map directly to what Arize customers need to instrument.
- › **Production GenAI at enterprise scale.** Isomer AI: shipped multi-model LLM pipelines (Claude, GPT-4o, Gemini) across a per-tenant insurance platform with Temporal.io durable orchestration, risk signal detection (CRITICAL/HIGH/STANDARD), and 30+ production deployments. I have debugged LLM failures in prod, not just in notebooks.
- › **MLOps observability infrastructure.** KubeServe: Kubernetes-native LLM inference platform with Open-Telemetry + Prometheus + Grafana end-to-end observability, KEDA autoscaling, and circuit breakers. 88 pytest tests, ArgoCD GitOps, load tested to 500 VUs. I understand the infra layer Arize customers are running on.
- › **Client-facing delivery at production cadence.** At Isomer AI I worked directly with enterprise insurance carriers — debugging issues, shipping integrations, and managing 30+ deployment cycles. The Forward Deployed model of embedded engineering + rapid delivery is how I have operated.

The companies that win on AI will be the ones that know when their models fail. Arize is the platform that makes that possible — I want to put it in front of more enterprise teams.
