

Browserbase sits at the exact intersection I have been building toward: browser automation as infrastructure for AI agents. I have shipped both sides of that stack in production.

Why I am a strong fit:

- **Production Playwright for real agent workflows.** At Isomer AI I built Playwright-based browser automation that navigates customer-internal insurance systems via Tailscale VPN — not scraping public pages, but executing authenticated, session-aware workflows inside enterprise networks as part of a durable Temporal.io pipeline. That is the same reliability bar Agent Platform operates at.
- **MCP servers — the protocol Browserbase runs on.** I built MCP servers in both Python and TypeScript at Isomer. MCP is how frontier AI labs (OpenAI, Anthropic, Google) connect models to tools — building and maintaining those integrations at production quality is precisely what the Agent Platform team does with OpenAI and Google.
- **Chrome extension + browser APIs.** GlanceAI: Chrome MV3 TypeScript extension with OAuth PKCE, Gmail API, IndexedDB, service worker, and BM25 search — all in-browser, no server. Deep familiarity with the browser extension model is directly adjacent to CDP and Puppeteer/Playwright internals.
- **TypeScript-first, high-agency shipping.** AlgoPulse: 2,000 req/sec real-time platform in TypeScript with Temporal.io + Kafka, deployed on AWS, load tested to 10K concurrent users. PulseRank: NestJS + Next.js + multi-DB consistency. Isomer: 30+ production deployments owning the full stack. I do not wait for perfect clarity — I ship and iterate.

Agent Platform is building the framework that powers how AI agents interact with the web. That is not a niche tool — it is infrastructure. I want to help build it.
