Hiring Team
Collective
San Francisco, CA

Dear Collective Team,

Collective's mission to give businesses-of-one the financial infrastructure that corporations take for granted is one of the most clearly defined and technically compelling problems I've seen. Replacing manual, error-prone financial workflows with software that just works — for people who are already managing everything alone — is exactly the kind of product I want to build. I'm applying for the Software Engineer (New Grad) role.

Here's what I bring:

- **Python backend and TypeScript full-stack, production-grade.** At Isomer AI, I owned the full backend stack — PostgreSQL, Redis, Docker, Terraform — across 923 commits and 7 production deployments. On the Python side, I built a FastAPI microservice (CortexQ) with Kubernetes autoscaling and 88 pytest tests; on TypeScript, I built PulseRank with NestJS, MySQL transactional writes with idempotency-key deduplication, and Testcontainers integration tests. Django patterns are a fast ramp from that foundation.
- **Automating workflows that replace manual processes.** This maps exactly to what Collective builds. At Mphas, I built a health claim automation pipeline (OCR + NLP + ML) that improved document processing accuracy by 25% across high-volume insurance workflows. At Capgemini, I built an NLP support ticket analysis system that cut resolution time by 15%. I've shipped automation that saves humans real time, at scale.
- **Testing culture from day one.** Every system I build has tests: 88 pytest unit tests on CortexQ, Testcontainers integration tests on PulseRank validating multi-store consistency, 110+ RSpec tests added to Expertiza (open source, 5,000+ users). I treat testing as part of shipping, not a separate step.
- **Ready to ship from week one.** Isomer gave me 12 months of on-call incident response, CI/CD ownership, and production engineering at SLA. I've handled real incidents, resolved production failures, and shipped to enterprise clients. This is unusual for a new grad — I won't need a long ramp to be useful.

I'd love to talk about how I can contribute to Collective's engineering team. Happy to discuss any of the technical details above.

Sincerely,
Aditya Kulkarni
