Hiring Team
Klaviyo
San Francisco, CA

Dear Klaviyo Team,

Klaviyo's platform processes billions of events, turning customer behavior signals into personalized marketing at scale. Building the systems behind that — high-throughput event pipelines, data-driven product features, and the UI that makes insights actionable — is the kind of full-stack engineering work I want to do. I'm applying for the Software Engineer role.

Here's what I bring:

- **Event-driven systems at scale, production-grade.** PulseRank is a real-time event-driven platform in TypeScript with NestJS and Next.js: MySQL transactional writes with idempotency-key deduplication, MongoDB feed projections with TTL, Redis sorted-set reads, and Testcontainers integration tests for multi-store consistency. AlgoPulse handles 2,000 async requests per second with zero state loss using Temporal.io + Kafka. This maps directly to Klaviyo's event processing architecture.
- **Python backend and AWS cloud infrastructure.** At Mphasis, I automated AWS and GCP deployments via CI/CD, integrated Grafana dashboards, and built Python-based OCR + NLP + ML workflows across high-volume enterprise pipelines. At NC State, I ran Python scikit-learn evaluation pipelines on 500GB+ datasets on GCP Cloud Run. Python and AWS are core to how I build and deploy.
- **Full-stack UI development across web and mobile.** React, Next.js, React Native, and NestJS are consistent across my projects — from PulseRank's data-rich dashboard to AlgoPulse's real-time React Native mobile client. I build the product layer, not just the API.
- **Production engineering ownership.** At Isomer AI, I owned 923 commits and 7 production deployments across a full backend stack — PostgreSQL, Redis, Docker, Terraform, Sentry APM — under enterprise SLA with on-call incident response. I understand what it takes to ship and maintain software at production quality.

I'd welcome the chance to talk about how I can contribute to Klaviyo's engineering team.

Sincerely,

Aditya Kulkarni
