

Senior Software Developer — Healthcare Analytics & AI, Oracle Health

June 20, 2026

Oracle Health is rebuilding healthcare data infrastructure with LLMs and AI agents at the center. I have been building exactly this combination — healthcare data pipelines, LLM evaluation frameworks, and agent-based automation — in production.

Why I am a strong fit:

- **Healthcare AI in production.** At Mphasis I built 5+ AI workflows for health claim automation — OCR, NLP, and ML pipelines processing 10K+ daily medical claims, improving document processing accuracy by 25%. The EHR and RCM domain this team works in is one I have shipped production systems for.
- **High-scale data pipelines and analytics dashboards.** VectorLift: Kafka-driven indexing pipeline into Elasticsearch and Qdrant vector store, FastAPI search API with per-stage latency tracking, Streamlit experiment comparison dashboard benchmarking 6 pipeline configurations with NDCG@10, MRR@10, and MAP. At Capgemini: Kafka + Spark + Hadoop ETL pipelines, cutting ticket-processing latency by 20% at peak load. This is the "data pipelines and ETL workflows" work the JD describes.
- **LLM agents for business automation.** At Isomer AI I shipped LLM risk signal detection (Claude/GPT-4o/Gemini) and MCP agent servers that drive customer-internal workflow automation across 30+ enterprise insurance carrier deployments. This is the "LLM/agent-based solutions for revenue leakage, readmissions, workflow automation" work the JD calls out explicitly.
- **LLMOps and model evaluation.** LLM Eval Harness: tracked hallucination rate, p50/p95 latency, and cost-per-call across Claude, GPT-4o, and Gemini on 2,000 frozen labeled examples with McNemar significance tests across 6 metrics. "Learn and apply best practices in LLMOps" is something I have already done in a rigorous, data-driven way.

Healthcare data at scale is one of the highest-impact engineering problems in existence. I want to build the pipelines and AI systems that make it work.
