

## Software Developer 2 — Oracle Health

June 20, 2026

Oracle Health is building the platform that modernizes how healthcare data flows, how claims are processed, and how AI improves patient outcomes. I have been building at exactly that intersection — AI workflows over healthcare data at production scale.

### Why I am a strong fit:

- **Healthcare AI in production.** At Mphasis I built 5+ AI workflows for health claim automation — OCR, NLP, and ML pipelines processing 10K+ daily medical claims, improving document processing accuracy by 25%. The domain Oracle Health is modernizing is one I have shipped production systems for.
- **Java + Spring Boot correctness.** *InventoryReservationService*: Java 21 + Spring Boot REST API with PostgreSQL row-level locking, idempotent endpoints, Spring Security RBAC, Flyway migrations, and Testcontainers concurrency tests verifying exactly one success under race conditions. Clean, testable, production-grade Java.
- **Data pipelines and dashboards at scale.** *VectorLift*: Kafka-driven indexing pipeline into Elasticsearch and Qdrant vector store, FastAPI search API with per-stage latency tracking, Streamlit experiment comparison dashboard benchmarking 6 pipeline configurations with NDCG@10, MRR@10, and MAP. This is the "large data pipelines and dashboards" work the JD describes.
- **Cloud-native distributed systems.** *KubeServe*: Kubernetes-native LLM inference platform with KEDA autoscaler, Kopf CRD operator, OTel + Prometheus + Grafana observability, ArgoCD GitOps, 88 pytest tests, load tested to 500 VUs. *Isomer AI*: 30+ production deployments on Fly.io + Temporal.io across 7 enterprise insurance carrier tenants.

Healthcare data at Oracle's scale is one of the most impactful engineering problems in existence. I want to build the platform that makes it work.
