Hiring Team
Voxel
San Francisco, CA

Dear Voxel Team,

Protecting workers from preventable injuries is one of the most direct ways software can save lives. The chance to build the application layer that translates Voxel's AI insights — PPE compliance, collision risk, hotspot detection — into actionable dashboards for enterprise safety teams is exactly the kind of high-stakes, meaningful work I want to do. I'm applying for the Software Engineer, Applications role.

Here's what I bring:

- **TypeScript + React + React Native, production-grade.** At Isomer AI, I shipped 10+ production features in TypeScript across a full backend stack — PostgreSQL, Redis, Auth0 RBAC, Docker, Terraform. On the frontend side, I built AlgoPulse: a TypeScript event-driven platform with a React Native mobile client handling 2,000 concurrent requests with real-time AI inference. React Native is listed as a preferred skill and I've shipped it in production.
- **Enterprise web apps and complex data flows.** PulseRank demonstrates the kind of application engineering Voxel needs: NestJS + Next.js with MySQL transactional writes, idempotency-key deduplication, MongoDB feed projections, Redis sorted-set reads, Testcontainers integration tests, and OpenTelemetry + Prometheus observability. I build systems that need to be right, not just fast.
- **Auth, access control, and production SLA.** Isomer gave me 12 months of on-call incident response and Auth0 RBAC implementation across enterprise clients. I've resolved production incidents under SLA, maintained CI/CD pipelines, and shipped to Fortune-caliber enterprise customers — exactly the environment Voxel operates in.
- **AI system integration across the application layer.** I've worked where AI outputs meet the product layer: integrating multi-model LLM pipelines (Claude, GPT-4o, Gemini), Temporal.io agentic workflows, and MCP tooling into customer-facing features. Translating model outputs into usable product experiences is work I've done at production scale.

I'd welcome the chance to talk about how I can contribute to Voxel's application engineering team.

Sincerely,

Aditya Kulkarni
