Mirage Engineering Team
New York, NY

Dear Mirage Engineering Team,

I am applying for the Software Engineer, Agents position at Mirage. The challenge of building agentic systems that make professional-grade creative decisions at scale is exactly the kind of foundational problem I want to work on.

My work sits at the intersection of agentic infrastructure and LLM evaluation, which maps directly to what this role requires:

- At Isomer AI, I designed and shipped a multi-agent AI workflow platform: Temporal.io durable orchestration, LLM risk signal detection across Claude, GPT-4o, and Gemini, MCP servers for tool integration, and Auth0 RBAC – serving 30+ enterprise deployments in production.
- I built a vendor-neutral LLM evaluation harness comparing three frontier models across 2,000 frozen examples, tracking hallucination rate, p50/p95 latency, cost-per-call, and applying McNemar significance tests – directly applicable to measuring and improving agent quality in production.
- AlgoPulse is an agentic orchestration platform built on Temporal.io and Kafka: multi-step reasoning, tool invocation, retry logic, and 2,000 async inference requests per second under load.

Mirage is tackling one of the hardest problems in generative media: getting AI agents to make creative decisions reliably and at scale. The combination of your research quality (Seeing Voices), your investor conviction, and the scope of the problem makes this exactly the environment I want to build in. I move fast, own problems end-to-end, and have a strong foundation in the evaluation and infrastructure work that makes agentic systems trustworthy in production.

I would welcome the opportunity to discuss how I can contribute to the agents team.

Sincerely,

Aditya Kulkarni
