To the Replit Engineering Team,

The hardest part of building on a cloud platform is not the infrastructure itself — it is the gap between what the platform exposes and what the user actually needs to succeed. Replit Cloud bridges that gap by owning the full stack: databases, storage, hosting, domains, dev/prod splits. The opportunity to build first-party cloud infrastructure that powers Replit Agent for millions of users is exactly the kind of problem I want to work on.

- **Full-Stack TypeScript, Shipped to Production:** At **Isomer AI**, I owned the full React/Node.js + TypeScript codebase — PostgreSQL, Redis, Docker, Terraform, Auth0 RBAC — shipping 10+ production AI features across 923 commits and 7 deployments. This is the same full-stack surface area Replit Cloud engineers own end to end.
- **Cloud Infrastructure from First Principles:** **CortexQ** is a Kubernetes-native LLM inference platform I built: KEDA autoscaler (scale-to-zero to N replicas), Kopf CRD operator, circuit breaker, EWMA load balancing, Helm + ArgoCD GitOps, and full OTel + Prometheus + Grafana observability. Building cloud infrastructure that actually holds under load requires exactly this kind of systems depth.
- **Agentic AI at Scale:** **AlgoPulse** sustained 2,000 async inference requests per second on Temporal.io and Kafka with sub-200ms SSE delivery. I identified a polling failure mode under load and rebuilt the delivery layer using event-driven architecture. Production AI systems for Replit Agent demand exactly this kind of iteration under real constraints.
- **Real-Time, Multi-DB Systems:** **PulseRank** is a TypeScript event-driven leaderboard: MySQL transactional writes, MongoDB TTL feed projections, Redis sorted sets for sub-millisecond reads, SSE delivery, load-tested at 10K concurrent users with Testcontainers + k6. Replit Cloud's database and storage layer is the same class of problem.

Replit is removing the barrier between having an idea and having software that runs. The Replit Cloud team makes that possible for millions of users. I want to help build it. I would be glad to discuss.

Sincerely,

Aditya Kulkarni
