To the Vercel Agent Stack Team,

Durable execution is what separates agent prototypes from production agents. I have built durable, resumable workflow systems on Temporal.io — the same primitive Vercel Workflows is bringing to TypeScript developers at platform scale — and I understand both the engineering and the developer experience challenges they solve. I want to help build Vercel Workflows into the backbone of the next generation of AI applications.

- › **Durable Execution and Workflow Orchestration in Production:** At **Isomer AI**, I built per-tenant agentic workflows on Temporal.io — durable orchestration with workflow versioning (Draft→Live→Archived), checkpoint-based execution, LLM risk signal pipelines, and MCP tool integrations across 30+ deployments. In **AlgoPulse**, I extended this to Kafka-backed multi-step reasoning at 2,000 async inference requests per second. Temporal.io is not a new tool for me — it is how I build agentic systems.
- › **TypeScript Ownership Across the Full Stack:** TypeScript is my primary language. At Isomer I owned the full codebase: React + Node.js, Auth0 RBAC, PostgreSQL, Redis, Playwright test coverage. In **PulseRank**, I built a production NestJS + Next.js system with MySQL, MongoDB, Redis, Testcontainers, and k6 benchmarking — Vercel's own ecosystem. I write TypeScript APIs that other developers want to use.
- › **AI/ML Framework Integration:** Through **KubeServe** and Isomer, I integrated Claude, GPT-4o, and Gemini behind model-agnostic routing layers with circuit breakers and EWMA load balancing. I also built MCP servers (Python + TypeScript) that extend agents with external tool access — directly relevant to Vercel Workflows' integration with Eve and the broader Agent Stack.
- › **Distributed Systems: Queues, State Machines, Failure Recovery:** Across AlgoPulse and KubeServe, I implemented retry logic, timeout handling, circuit breakers, and graceful degradation for async workflow systems. Understanding how durable systems fail — and how to recover — is where I built my confidence in this space.

Vercel Workflows will do for async agents what Next.js did for web apps. I want to help build that. I would be glad to discuss.

Sincerely,

Aditya Kulkarni
