WellSky Engineering Team
Overland Park, KS

Dear WellSky Engineering Team,

I am applying for the Associate Software Engineer position at WellSky. Building reliable software that improves care coordination and outcomes for real patients is meaningful work, and my background in full-stack development, cloud infrastructure, and AI-enabled workflows maps directly to what this role requires.

Key areas of fit:

- ▶ At Isomer AI, I built and shipped a production AI workflow platform in TypeScript serving 30+ enterprise customers, integrating Claude, GPT-4o, and Gemini for risk signal detection, with Auth0 RBAC and full CI/CD on GCP. This is the kind of full-stack, AI-enabled software development WellSky is investing in.
- ▶ PulseRank is a TypeScript/React platform with MySQL transactional writes, MongoDB projections, and Redis sorted sets, benchmarked at 10,000 concurrent users with Testcontainers integration tests – directly relevant to building scalable, reliable healthcare applications.
- ▶ I built a vendor-neutral LLM evaluation harness comparing Claude, GPT-4o, and Gemini across 2,000 labeled examples, tracking latency, cost, and quality metrics. Experience with AI tools including Claude Code is a preferred qualification here, and it is central to how I develop software.

I am a fast learner, comfortable owning projects end-to-end, and motivated by work that has direct impact on people's lives. WellSky's focus on intelligent, coordinated care is a mission I find genuinely compelling.

Sincerely,

Aditya Kulkarni
