To the Wispr Flow Engineering Team,

Sutton's Bitter Lesson holds: general methods that leverage scale beat hand-crafted solutions over time. Wispr Flow is applying this principle to the one interface we still haven't scaled past our own limitations — human voice. A dictation product that 1.5 million people reach for instead of their keyboards isn't just a feature; it's proof that the interface layer is being rebuilt from scratch. The Labs team is where I want to be while that happens.

- › **Prototype to Production, End-to-End:** I built **AlgoPulse** from scratch — agentic AI orchestration on Temporal.io and Kafka, sustaining 2,000 async inference requests per second with sub-200ms SSE delivery to clients. I identified the API-polling bottleneck under load, pivoted to Supabase Edge Functions, and shipped a working system. Labs is prototype-first; I've done that under pressure in 48-hour hackathons and in production.
- › **Agentic Framework Experience:** At **Isomer AI**, I shipped Temporal.io agentic workflows and multi-model LLM pipelines (Claude, GPT-4o, Gemini) into a production product. The next evolution of Wispr Flow — native actions that understand context and act reliably — is exactly the architecture I've built and debugged at scale.
- › **Real-Time Systems Depth:** **PulseRank** showed I understand low-latency data flows end-to-end: Redis sorted sets for sub-millisecond reads, SSE for live updates, Testcontainers for consistency validation at 10K concurrent users. Voice AI demands the same rigor: you can't buffer or retry a spoken command.
- › **Bias Toward Shipping:** 923 commits and 7 production deployments at Isomer AI in under a year. Six national hackathon placements with full-stack MVPs built end-to-end in 48-hour sprints. I'm attached to the mission, not any one implementation.

Wispr Flow is solving the right problem at the right moment. I want to help build the agentic layer that comes next. I would love to talk.

Sincerely,

Aditya Kulkarni
