Y Combinator Software Team
San Francisco, CA

Dear YC Software Team,

I am applying for the Product Engineer, New Products role. Building AI-native developer tools from zero to one, owning the full product and user experience, and shipping work that reaches real communities is the exact kind of work I want to do – and YC is the right place to do it.

Three things that are directly relevant:

- At Isomer AI, I took a multi-tenant AI workflow platform from zero to 30+ production deployments: Temporal.io durable orchestration, LLM risk signal detection across Claude/GPT-4o/Gemini, MCP server integrations, and full-stack TypeScript ownership with no PM and no designer. That is the kind of end-to-end product engineering this role requires.
- I built a vendor-neutral LLM evaluation harness comparing Claude, GPT-4o, and Gemini across 2,000 frozen examples, tracking hallucination rate, latency, cost-per-call, and statistical significance with McNemar tests. This is the kind of rigorous AI-native tooling – the sort of thing gstack and gbrain are built to enable – that I think about and build by default.
- AlgoPulse is a production agentic orchestration platform on Temporal.io and Kafka: multi-step reasoning, tool invocation, retry logic, sustained 2,000 async inference requests per second. I designed, built, and deployed it end-to-end.

The combination of YC program access, a small high-trust team with no rigid roadmaps, and the mandate to ship products people actually use – that is not a common opportunity. I have read about gstack and gbrain and the 130,000+ GitHub stars they have accumulated; I understand what it takes to build developer tools that earn that kind of adoption, and I want to contribute to that.

I am completing my MSCS at NC State in May 2026 and am available immediately. I would welcome the chance to talk.

Sincerely,

Aditya Kulkarni
